

Corn GDU Report

Generated 4/16/2026

Emergence Estimates

Daily weather station data is utilized to calculate the corn base 50° F daily GDU calculation using this formula: $(\text{daily maximum air temperature } ^\circ\text{F} + \text{daily minimum air temperature } ^\circ\text{F})/2 \text{ minus } 50^\circ = \text{Growing Degree Units/Days (GDU or GDD)}$. Base = 50°F, max = 86°F. Corn estimates assume a planting depth of 2". Soil temperature is a model estimate from TWC at 2" depth.

Location	Planting Date	Est. Emergence Date	Days to Emergence	Risk Level
New Hampton	4/27/2026	May 13, 2026	16	Medium Risk (11-17)

DISCLAIMER: The emergence-risk forecast herein was created using forecasted weather information, agronomic data and insight, and assumes a 2" planting depth for corn and 1" planting depth for cotton. The model output does not guarantee accuracy or certainty of information because of the uncertainty in climate forecasting and other factors impacting emergence (e.g., planting depth, compaction, etc.). Additionally, other soil and seed management conditions and/or practices at planting time may change the outcome of these emergence-risk estimates. Bayer specifically disclaims all warranties, expressed or implied, with respect to the use of this information. For additional product information call toll-free 1-866-99-BAYER (1-866-992-2937) or visit our website at www.BayerCropScience.us. Daily GDU °F

- Low Risk (10+)
- Medium Risk (5 to 9.99)
- Medium-High Risk (2 to 4.99)
- High Risk (0 to 1.99)

Cold Risk Warning

- 32°F or below

Imbibitional Chilling Risk

- Alert — Daily GDU 0-3.00 + precip trigger
 - Caution — Daily GDU 3.01-6.00 + precip trigger
- Precip trigger: sum of forecast Precip In. for current date +/- 2 days >= 0.10 in.

Crop: **Corn**
